

# ML OPS

# MACHINE LEARNING OPERATIONS

**MLOps, or Machine Learning Operations, is a set of practices, tools, and processes that aim to streamline and automate the end-to-end machine learning (ML) lifecycle. It combines principles from DevOps, data engineering, and machine learning to ensure that ML models are developed, deployed, monitored, and maintained efficiently and reliably**

# The Biryani Mastery

A STORY OF  
GROWTH

BRO, THIS IS INSANE! WHERE HAVE YOU BEEN HIDING THIS TALENT?  
THIS IS RESTAURANT-LEVEL BIRIYANI!" "YOU SHOULD START A  
BUSINESS!" "I'D PAY FOR THIS ANY DAY!

SOMETHING'S DIFFERENT TODAY... DID YOU  
CHANGE THE RECIPE?

I love your biriyani, but can you make it spicier?

MILD DUM BIRYANI  
SPICY DUM BIRYANI

Your biriyani is amazing, but I prefer it milder

***MUTTON DUM BIRYANI***

***PANEER BIRYANI***

# AUTOMATION

---

A digital inventory system  
to track ingredient levels

Timers to alert chefs when  
the biriyani was perfectly  
cooked

A mobile feedback app  
where customers could  
rate their biriyani

Business Challenge	MLOPS Content	MLOPS TOOL	EXPLANATION
Buying ingredients daily manually	Automated Data Pipelines	Automated Data Pipelines	Just like Ravi set up a supplier to deliver fresh ingredients daily, MLOps pipelines automate data collection and processing to ensure fresh and reliable data.
Standardizing the recipe	CI/CD for ML Models	GitHub Actions, GitLab CI/CD	Ravi wrote down exact spice measurements to ensure consistency. CI/CD ensures models perform the same across environments.
Expanding food stalls	Scaling Up ML Models	Kubernetes, TensorFlow Serving	Ravi's new food stalls needed the same quality of biriyani. Similarly, Kubernetes helps scale ML models while maintaining consistency.
Adjusting spice levels based on customer preferences	Continuous Model Monitoring	Prometheus, Evidently AI	Just like Ravi introduced mild and spicy variants based on feedback, model monitoring tools track performance and adjust ML models accordingly.
Testing new biriyani recipes	A/B Testing for ML Models	MLflow, DVC	Ravi first tested new biriyani types at one location before expanding. A/B testing helps validate ML model changes before full deployment.

Business Challenge	MLOPS Content	MLOPS TOOL	EXPLANATION
Handling bad ingredients	Model Rollbacks	MLflow Model Registry	When bad rice affected the biriyani, Ravi quickly switched suppliers. Similarly, ML model registries allow rolling back to a previous, stable version.
Using ingredient kits for uniformity	Containerization & Portability	Docker	Ravi's pre-packaged ingredient kits ensured consistency across locations, just like Docker containers keep ML models consistent across different environments.

Data Collection and Preparation

Model Development

Model Training

Model Evaluation and Deployment

Lack of Reproducibility

Slow Time-to-Production:

Poor Collaboration

Scalability Issues

Model Decay

Lack of Governance

Reproducibility

Faster Time-to-Production
